Scenario = PCM - Multi-Dimensional Product Variants?

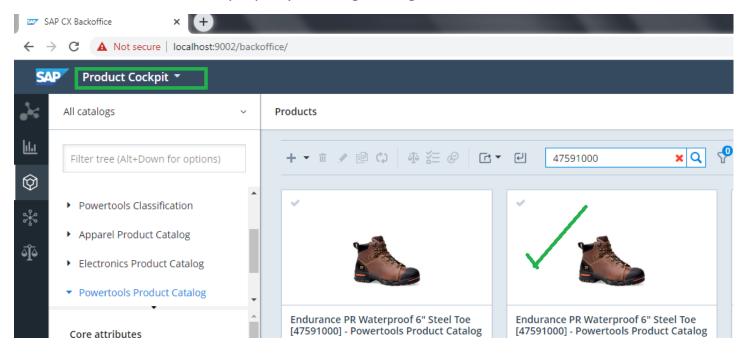

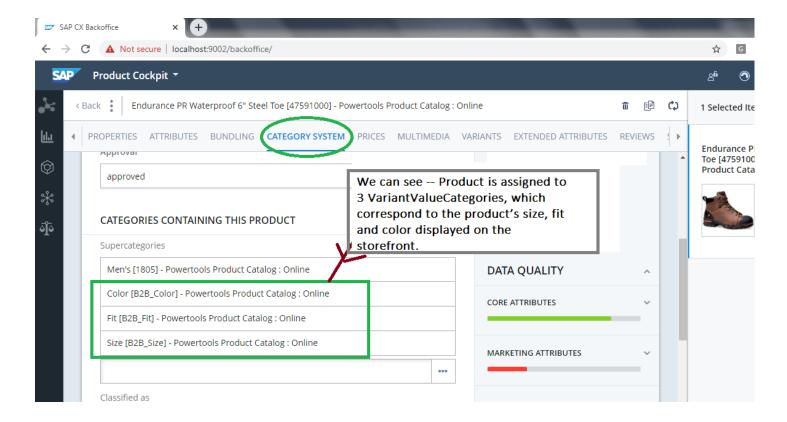

Example =

For "SAP Commerce Cloud" --- Contact Us = ChennaReddyTraining@RRRS.CO.IN

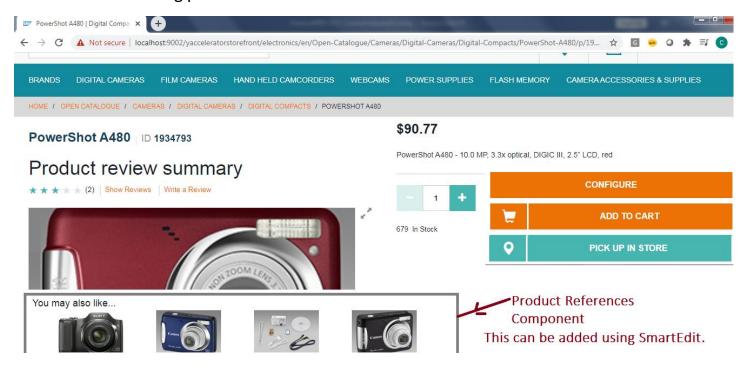

Now - Let's see how do the property values get assigned?

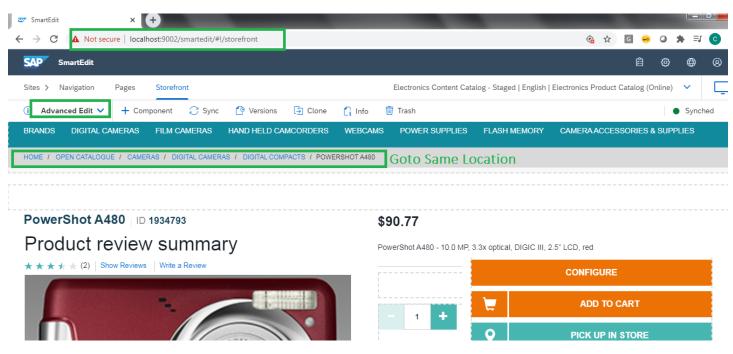

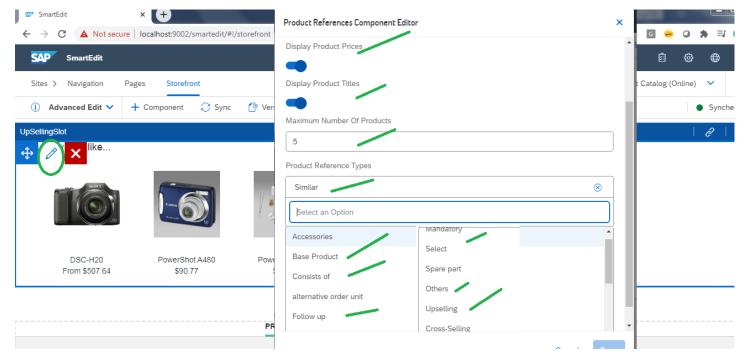

Scenario = PCM - Configuring the Cross-Selling Component?

Vendor displays related products when customer is in "PDP [Product Details Page]". This maximize cross-selling potential.

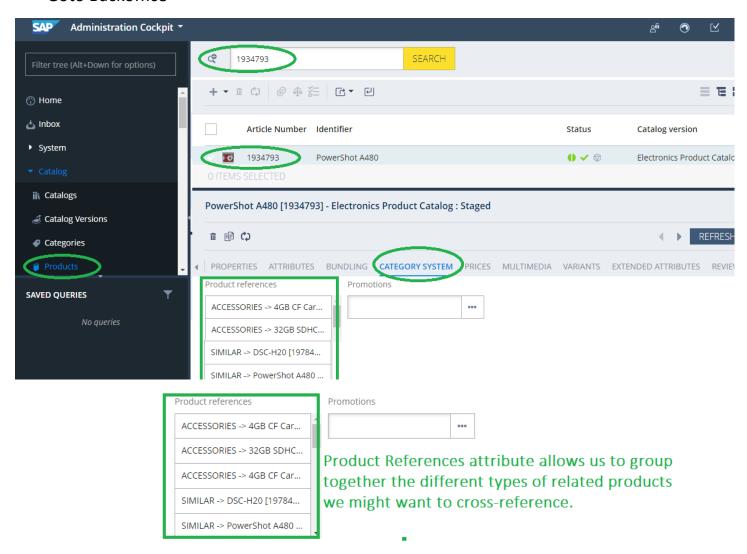

== Goto SmartEdit & Change

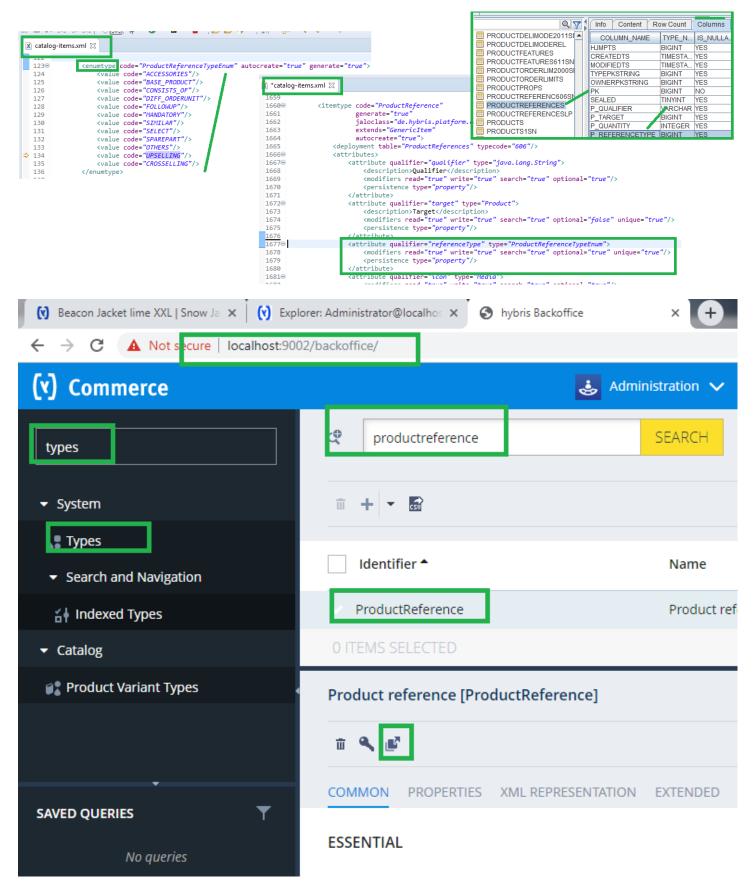

=== Goto Backoffice

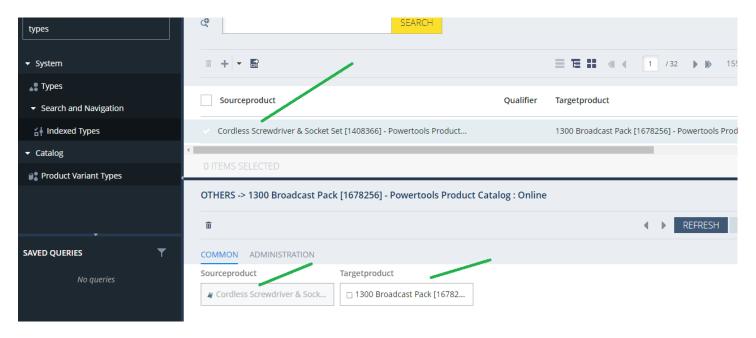

For "SAP Commerce Cloud" --- Contact Us = ChennaReddyTraining@RRRS.CO.IN

Scenario = Explain **ProductReferences** (or) How we can configure Similar Items (or) How we can configure "Cross-Selling" Products (or) How we can configure "Upselling" products (or)?

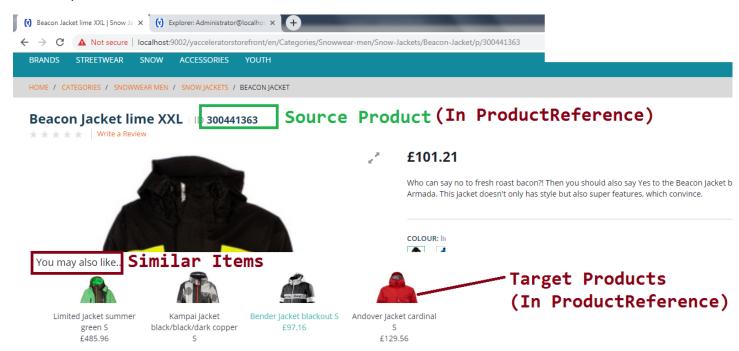

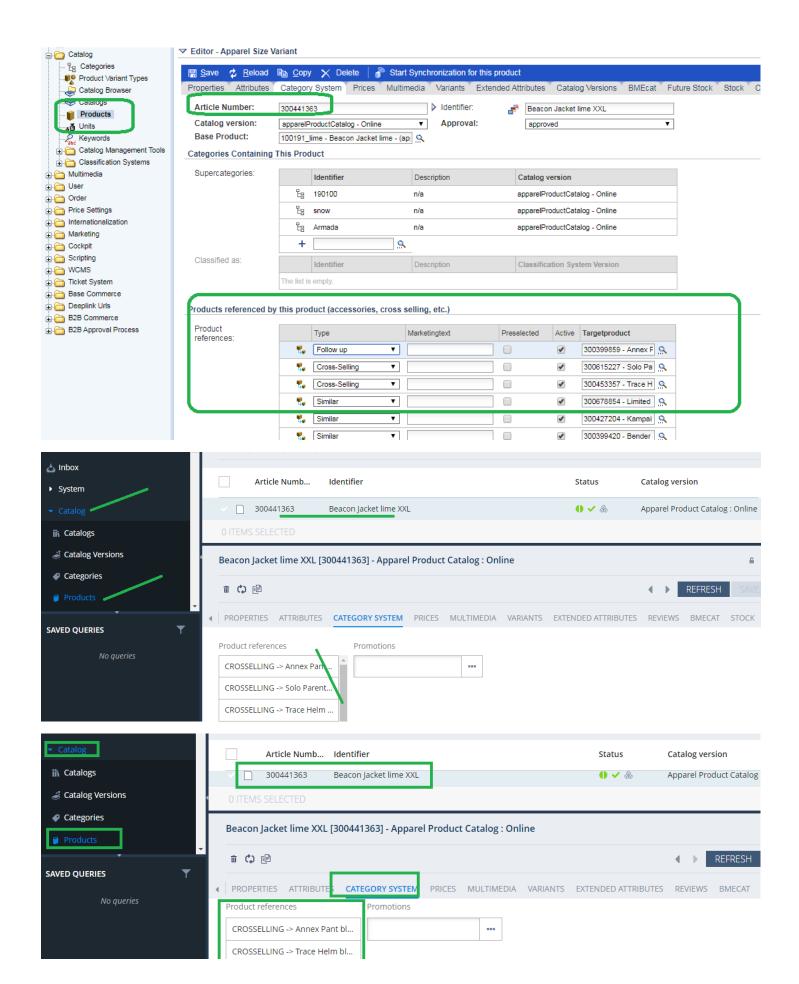

For "SAP Commerce Cloud" --- Contact Us = ChennaReddyTraining@RRRS.CO.IN

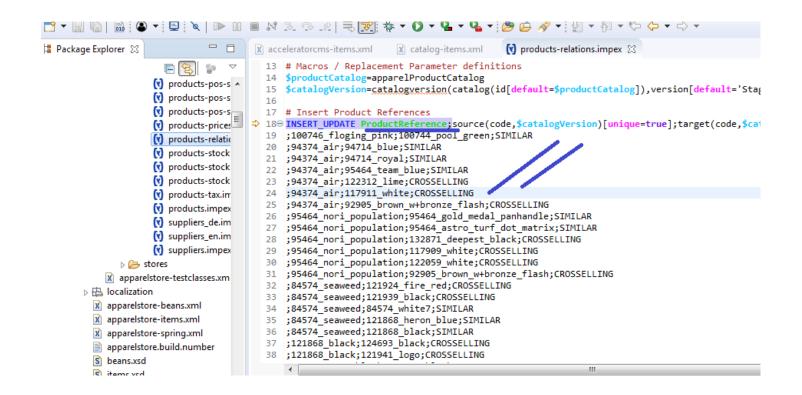

ProductReferences table mainly has 4 important Cols: -

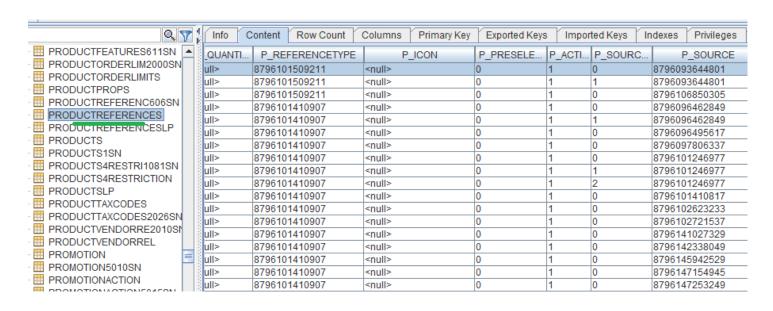

- 1) Source Product
- 2) Target Product
- 3) Reference Type
- 4) Active

For "SAP Commerce Cloud" --- Contact Us = ChennaReddyTraining@RRRS.CO.IN

Scenario = Explain PCM - Configurable Products?

Configurable products are products that require additional information from the customer to complete the purchase flow.

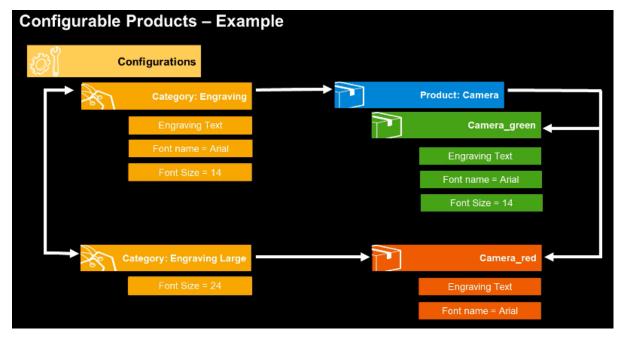

Example = If we want to complete the purchase of a car, we need to select which engine should be built into the car, which color the car should have, and many other properties of the car.

OOTB = These Configurable properties belong to certain product are called **configurator** settings.

Configurator settings are linked to products and available in Orders & Carts.

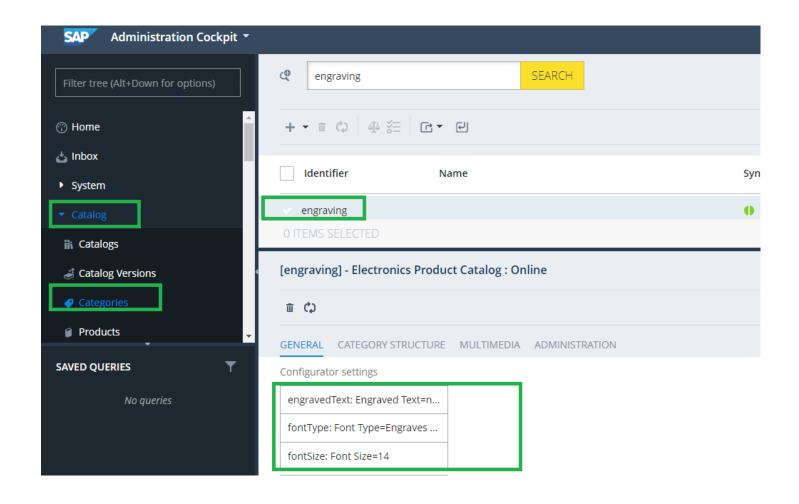

To support these, 2 new data types are implemented: -

- Configurator Settings = Represent the actual configurable properties.
 These are catalog aware. That means that they can be associated with the staged version for editing. And then synchronized to the online version when ready.
- 2) Configuration Category = Can then group products or product variants together and pass the configurator settings to those products.

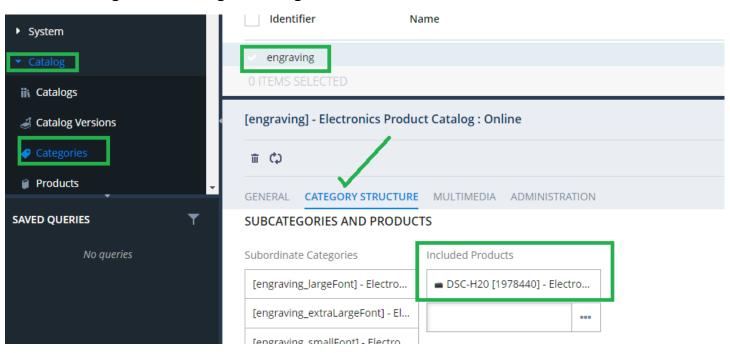

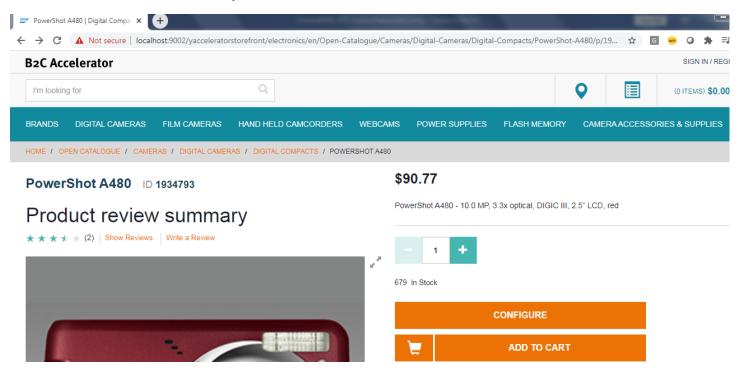

For "SAP Commerce Cloud" --- Contact Us = ChennaReddyTraining@RRRS.CO.IN

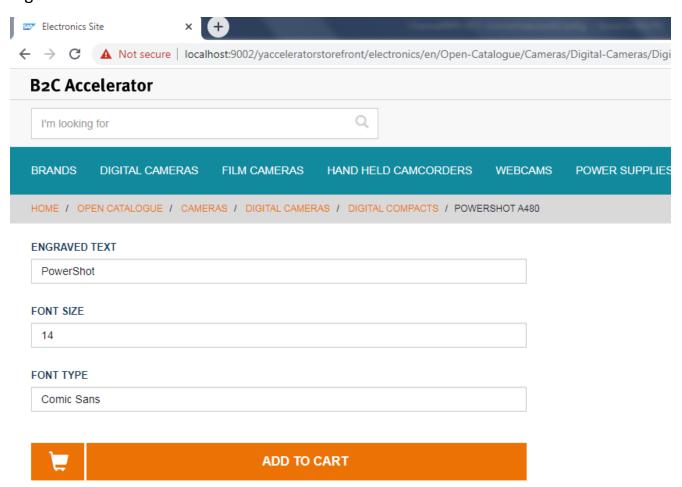

=== This Configurator Settings are assigned to "DSC-H20"

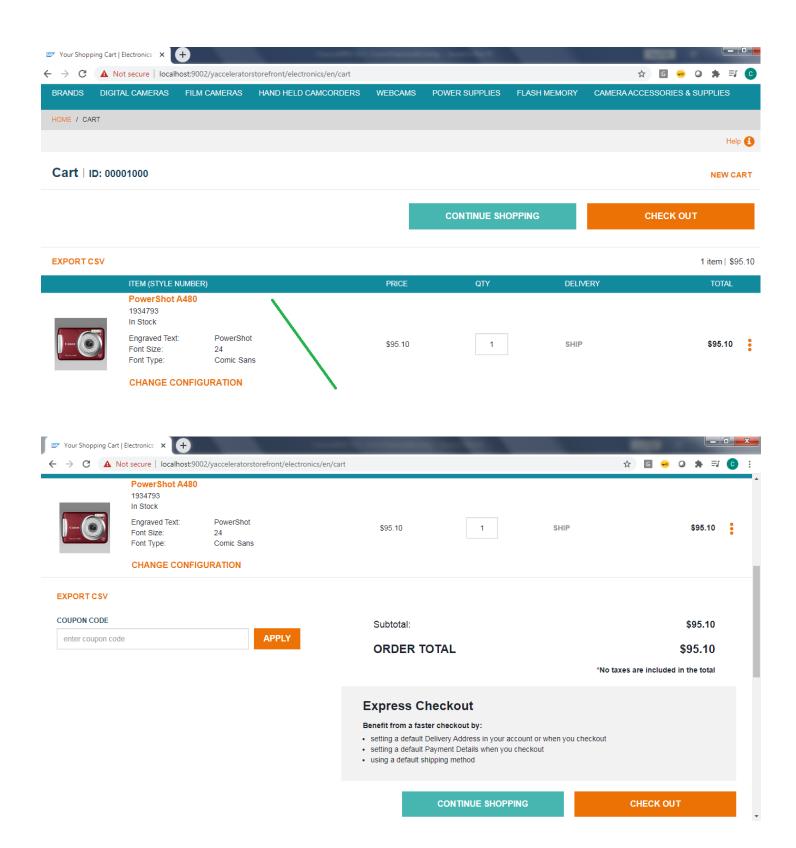

=== Goto Site & Search for "/p/1934793"

== Configure

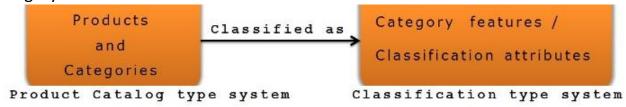

Scenario = Explain Product Modeling?

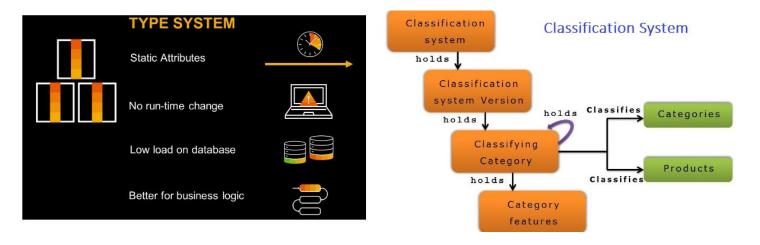

Every product in market will have different characteristics & attributes. To sell products online, we need to model the products. OOTB gives standard business model & can customize for business needs.

There are 2 systems: -

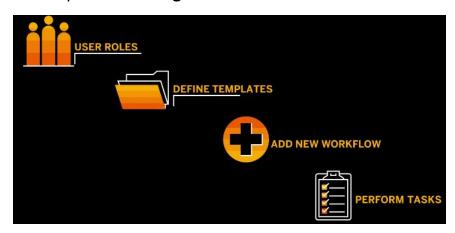

- Type System = Base for all objects [Products, Orders, Categories, Cronjobs and ...].
 Type system Will have "Static Attributes [Attribute will not change]".
 Advantage = Low load on DB. Faster performance. Better for business logic.
- 2) Classification System = Only applied for Products. Can be adjusted at runtime using "Backoffice – Admin Cockpit". Classification category -- Does not give any "Java Setters & Getters". The use classification feature in business logic requires more efforts than Type system. Category features are also referred to as classification attributes

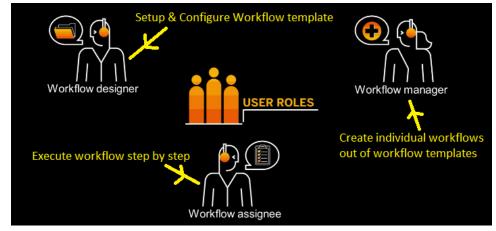

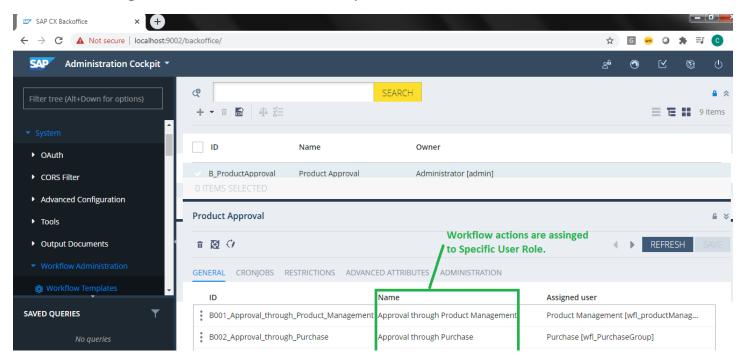

For "SAP Commerce Cloud" --- Contact Us = ChennaReddyTraining@RRRS.CO.IN

Scenario = Explain "Working with Workflows in SCC"?

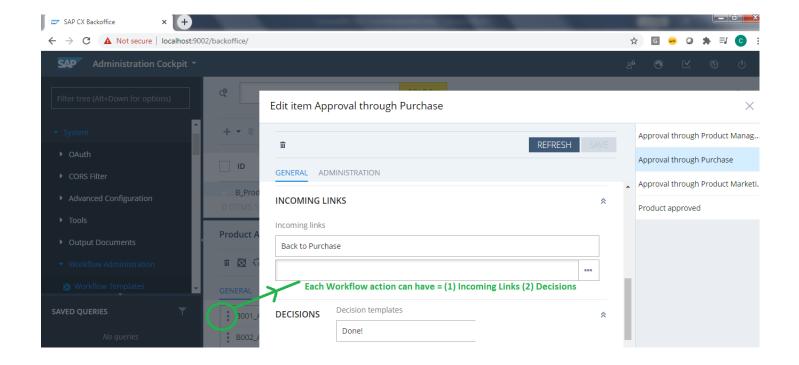

Workflow Designer = Defines Workflow Templates

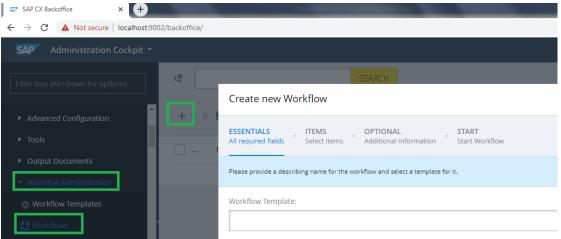

For "SAP Commerce Cloud" --- Contact Us = ChennaReddyTraining@RRRS.CO.IN

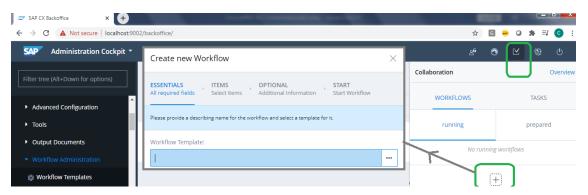

Workflow Manager = Creates Workflow [Try to login as Workflow Manager]

These are 2 ways to do this =

 $(1) \rightarrow \text{Workflows} \rightarrow [+] \& \text{Fill required information}$

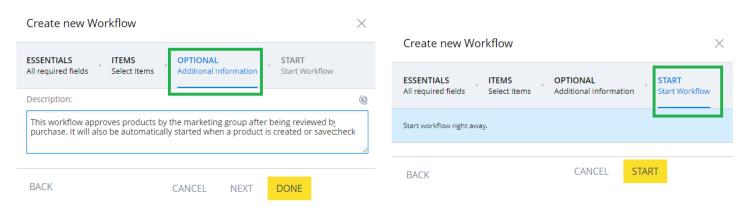

(2) Use Collaboration Section → [+] & Fill required information

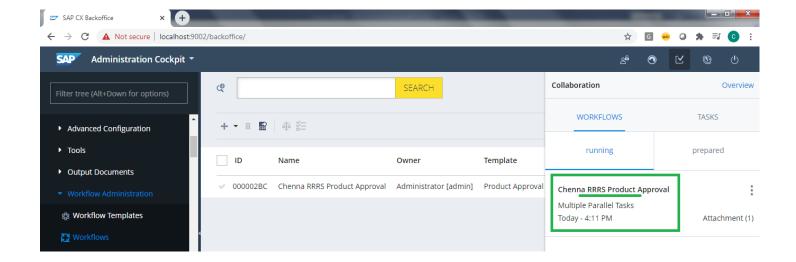

Workflow Step1 & Step2 =

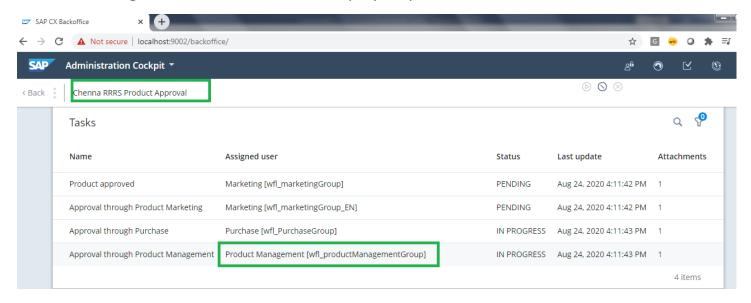

Workflow Step3 & Step4 =

Workflow Assignee = Execute workflow Step by Step.

Goto Backoffice with =
